### APPLICATIONS

→Our goal:  $D(E(\mathbf{m}) + \text{noise}) = \mathbf{m}$

## MAXIMUM LIKELIHOOD DECODING (MLD)

Given a received word  $\mathbf{y} \in \mathbb{F}_q^n$ , find  $\mathbf{x}$  that maximizes the probability:  
 $\mathbb{P}(\mathbf{y} \text{ received} / \mathbf{x} \text{ sent})$

On symmetric channel **MLD** → **Minimum Distance Decoding (MDD)**

Output the closest codeword in Hamming distance to the received word.

### Unique Decoder

Find a **unique** codeword that minimizes the Hamming distance to the received vector.

### Complete Decoder

Find **all** codewords nearest to the received vector.

## COMPLETE MINIMUM DISTANCE DECODING

Given a received vector  $\mathbf{y} \in \mathbb{F}_q^n$  find one of the closest codewords in  $\mathcal{C}$ .

### APPLICATIONS

## FIRST IDEA: BRUTE FORCE

Compute the Hamming distance of the received word with all codewords.

→ The complexity is  $\mathcal{O}(nq^k)$

→ Known complete decoding methods with complexity asymptotically less than that of exhaustive search can be divided mainly into three groups:

- 1 **Syndrome Decoding**
- 2 **Gradient Descent Decoding**
- 3 **Information Set Decoding**

# SYNDROME DECODING

Let  $\mathcal{C}$  be an  $[n, k]$  code in  $\mathbb{F}_q$ .

Let  $\mathbf{x} \in \mathbb{F}_q^n$ , the set  $\mathbf{x} + \mathcal{C}$  is called a **coset** of  $\mathcal{C}$ .

- Two vectors  $\mathbf{x}$  and  $\mathbf{y}$  belong to the same coset  $\iff \mathbf{y} - \mathbf{x} \in \mathcal{C}$ .
- The cosets form a **partition** of the space  $\mathbb{F}_q^n$  into  $q^{n-k}$  **classes** each containing  $q^k$  **elements**.

The words of **minimal Hamming weight** in the cosets of  $\mathbb{F}_q^n/\mathcal{C}$  are the set of **coset leaders** for  $\mathcal{C}$ .

- $\text{CL}(\mathcal{C})$ : Set of coset leaders of  $\mathcal{C}$ .
- $\text{CL}(\mathbf{y})$ : Subset of coset leaders corresponding to the coset  $\mathcal{C} + \mathbf{y}$ .

Choose a parity check matrix  $H$  for  $\mathcal{C}$ . The **Syndrome** of a vector  $\mathbf{x} \in \mathbb{F}_2^n$  is the vector

$$S(\mathbf{x}) = H\mathbf{x}^T \in \mathbb{F}_q^{n-k}$$

- The syndrome of a codeword is  $\mathbf{0}$ .
- Two vectors that differ by a codeword have the same syndrome, i.e.

$$H\mathbf{y}^T = H(\mathbf{c} + \mathbf{e})^T = \mathbf{0} + H\mathbf{e}^T$$

## THEOREM:

Two vectors belong to the same coset  $\iff$  They have the same syndrome.

CONCLUSIONS

APPLICATIONS

## CLASSICAL SYNDROME DECODING

- 1 Construct the **syndrome lookup table**.

i.e. enumerate the cosets of  $\mathcal{C}$  in  $\mathbb{F}_q^n$ , choose a coset leader for each coset and compute its syndrome.

- 2 If  $\mathbf{y}$  is the received word  $\Rightarrow$  Determine from the table which coset leader  $\mathbf{e}$  satisfies that  $S(\mathbf{y}) = S(\mathbf{e})$ .
- 3 Decode  $\mathbf{y}$  as  $\mathbf{y} - \mathbf{e} \in \mathcal{C}$ .

The precomputation of this method **grows exponentially** with the length of the code  $\sim \mathcal{O}(nq^{n-k})$ .

→ La siguiente matriz

$$G = \begin{pmatrix} 1 & 0 & 0 & 0 & 1 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 1 & 1 & 0 \end{pmatrix} \in \mathbb{F}_2^{3 \times 6}$$

genera un código de parámetros  $[n = 6, k = 3, d = 3]$ .

→ Un ejemplo de palabra del código es:

$$(0, 1, 1) \cdot G = (0, 1, 1, 0, 1, 1)$$

→ Una matriz de paridad del código es:

$$H = \begin{pmatrix} 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 1 & 1 & 0 & 1 & 1 \\ 0 & 0 & 0 & 1 & 1 & 1 \end{pmatrix} \in \mathbb{F}_2^{3 \times 6}$$

Observamos que  $G \cdot H^T = 0$ .

→ Este código detecta  $d - 1 = 2$  errores y puede corregir  $\left\lfloor \frac{d-1}{2} \right\rfloor = 1$  error.

### APPLICATIONS

Syndrome	Coset Leader
000	$\mathbf{0}$
001	$\mathbf{e}_6$
010	$\mathbf{e}_5$
011	$\mathbf{e}_1$
100	$\mathbf{e}_4$
101	$\mathbf{e}_2$
110	$\mathbf{e}_3$
111	$\mathbf{e}_1 + \mathbf{e}_4, \mathbf{e}_2 + \mathbf{e}_5, \mathbf{e}_3 + \mathbf{e}_6$

TABLE: Tabla de Síndromes para  $\mathcal{C}$

→ Recibimos el vector  $\mathbf{y} = (1, 1, 0, 1, 0, 0) \in \mathbb{F}_2^6$ .

Calculamos su síndrome  $S(\mathbf{y}) = \mathbf{H}\mathbf{y}^T = 010$ .

Descodificamos  $\mathbf{y}$  por  $\mathbf{y} - \mathbf{e}_5 = (1, 1, 0, 1, 1, 0)$ .

→ Recibimos el vector  $\mathbf{y} = (1, 0, 0, 1, 0, 0) \in \mathbb{F}_2^6$ .

Calculamos su síndrome  $S(\mathbf{y}) = \mathbf{H}\mathbf{y}^T = 111$ .

La clase de equivalencia de  $\mathbf{y}$  tiene 3 coset leaders. Existen por lo tanto tres posibles soluciones:

- $\mathbf{y} + \mathbf{e}_1 + \mathbf{e}_4 = \mathbf{0}$ ,
- $\mathbf{y} + \mathbf{e}_2 + \mathbf{e}_5 = (1, 1, 0, 1, 1, 0)$
- $\mathbf{y} + \mathbf{e}_3 + \mathbf{e}_6 = (1, 0, 1, 1, 0, 1)$

## TEST-SET

A **Test-set** for  $\mathcal{C}$  is a subset  $\mathcal{T}_{\mathcal{C}} \subset \mathcal{C}$  such that for every vector  $\mathbf{y} \in \mathbb{F}_q^n$  either  $\mathbf{y} \in \text{CL}(\mathcal{C})$  or there exists  $\mathbf{t} \in \mathcal{T}_{\mathcal{C}}$  such that  $w_H(\mathbf{y} - \mathbf{t}) < w_H(\mathbf{y})$ .

## GENERAL PRINCIPLE

- 1 Precomputed and stored in memory a Test-set  $\mathcal{T}_{\mathcal{C}}$  for  $\mathcal{C}$  in advance.
- 2 Recursively inspect the Test-set  $\mathcal{T}_{\mathcal{C}}$  for the existence of an adequate element which is subtracted from the current vector.

The complexity is  $\mathcal{O}(n|\mathcal{T}_{\mathcal{C}}|)$ .

APPLICATIONS TO OTHER CLASSES  
OF CODES

A SEMIGROUP APPROACH

THE SEMIGROUP ASSOCIATED WITH  
A MODULAR CODE  
THE SEMIGROUP ASSOCIATED WITH  
A LINEAR CODE  
CONCLUSIONS

APPLICATIONS

- $\mathbb{K}[\mathbf{x}]$  = polynomial ring in  $n$  variables over the field  $\mathbb{K}$
- $[X]$  = set of monomials of  $\mathbb{K}[\mathbf{x}] = \{ \mathbf{x}^{\mathbf{a}} = x_1^{a_1} x_2^{a_2} \cdots x_n^{a_n} : \mathbf{a} \in \mathbb{Z}_{\geq 0}^n \}$
- A **term order** on  $\mathbb{K}[\mathbf{x}]$  is a total well-ordering  $\succ$  on  $[X]$  such that:

$$\mathbf{x}^{\mathbf{a}} \succ \mathbf{x}^{\mathbf{b}} \Rightarrow \mathbf{x}^{\mathbf{a}+\mathbf{c}} \succ \mathbf{x}^{\mathbf{b}+\mathbf{c}} \text{ for all } \mathbf{a}, \mathbf{b}, \mathbf{c} \in \mathbb{Z}_{\geq 0}^n.$$

**Example:** *degree lexicographic order* ( $\text{deglex}$ )

$$\mathbf{x}^{\mathbf{a}} \succ_{\text{deglex}} \mathbf{x}^{\mathbf{b}} \iff \deg(\mathbf{x}^{\mathbf{a}}) > \deg(\mathbf{x}^{\mathbf{b}}) \text{ or } \deg(\mathbf{x}^{\mathbf{a}}) = \deg(\mathbf{x}^{\mathbf{b}}) \text{ and } \mathbf{a} \succ_{\text{lex}} \mathbf{b}$$

- **Leading term** of  $f(\mathbf{x}) \in \mathbb{K}[\mathbf{x}]$  w.r.t.  $\prec = \text{LT}_{\prec}(f)$ .
- Let  $I$  be an ideal in  $\mathbb{K}[\mathbf{x}]$ , the **initial ideal** is  $\text{in}_{\prec}(I) = \langle \text{LT}_{\prec}(f) : f \in I \rangle$ .

## GRÖBNER BASIS

A finite subset  $\mathcal{G}$  of  $\mathcal{I}$  is a Gröbner basis w.r.t the term order  $\succ$  if

$$\text{in}_{\succ}(\mathcal{I}) = \langle \text{LT}_{\succ}(g) : g \in \mathcal{G} \rangle.$$

## THEOREM

If  $\succ$  is fixed, then every ideal  $\mathcal{I} \subseteq \mathbb{K}[\mathbf{x}]$  has a unique reduced Gröbner basis.

The reduced Gröbner basis  $\mathcal{G}$  can be computed from any generating set of  $\mathcal{I}$  by a method introduced by Bruno Buchberger in 1965.

## 2 BINARY CODES

- Gröbner representation
- Computing coset leaders
- Gradient Descent Decoding

→ Throughout this section  $\mathcal{C}$  will be a **binary linear code** of length  $n$  and dimension  $k$ , i.e. a  $k$ -dimensional linear subspace of  $\mathbb{F}_2^n$ .

→ This section essentially follows:

A MODULAR CODE

THE SEMIGROUP ASSOCIATED WITH  
A LINEAR CODE

CONCLUSIONS

APPLICATIONS

→ Let  $\mathcal{C}$  be an  $[n, k]$  binary code.

**Characteristic crossing functions:**

$$\blacktriangledown : \mathbb{Z}^S \longrightarrow \mathbb{Z}_2^S \quad \text{and} \quad \blacktriangle : \mathbb{Z}_2^S \longrightarrow \mathbb{Z}^S .$$

- The map  $\blacktriangledown$  is reduction modulo 2.
- The map  $\blacktriangle$  replaces the class of 0, 1 by the same symbols regarded as integers.

**THEOREM [BORGES-BORGES-FITZPATRICK-MARTÍNEZ (2008)]**

Let  $\{\mathbf{w}_1, \dots, \mathbf{w}_k\}$  label the rows of a generator matrix for  $\mathcal{C}$ .

$$I(\mathcal{C}) = \left\langle \{ \mathbf{X}^{\blacktriangle \mathbf{w}_i} - 1 \}_{i=1, \dots, k} \cup \{ x_j^2 - 1 \}_{j=1, \dots, n} \right\rangle$$

**THEOREM [BORGES-BORGES-FITZPATRICK-MARTÍNEZ (2008)]**

Any reduced **Gröbner basis**  $\mathcal{G}$  of  $I(\mathcal{C})$  relative to a degree compatible ordering induce a **test-set** for  $\mathcal{C}$ .

**COROLLARY**

$\text{Red}(\mathbf{X}^{\mathbf{a}}, \mathcal{G}) = \mathbf{X}^{\mathbf{e}}$  provides a **coset leader** even if  $w_H(\mathbf{e}) \geq t$

Let  $\{\mathbf{e}_i \mid i \in \{1, \dots, n\}\}$  be a canonical basis of  $\mathbb{F}_2^n$ .

## GRÖBNER REPRESENTATION

A **Gröbner representation** of an  $[n, k]$  binary linear code  $\mathcal{C}$  is a pair  $(\mathcal{N}, \phi)$  where:

- $\mathcal{N}$  is transversal of the cosets in  $\mathbb{F}_2^n/\mathcal{C}$  verifying that:

$$\rightarrow \mathbf{0} \in \mathcal{N}$$

$$\rightarrow \mathbf{n} \in \mathcal{N} \setminus \{\mathbf{0}\} \implies \exists i \in \{1, \dots, n\} : \mathbf{n} = \mathbf{n}' + \mathbf{e}_i \text{ with } \mathbf{n}' \in \mathcal{N}$$

- $\phi : \mathcal{N} \times \{\mathbf{e}_i\}_{i=1}^n \longrightarrow \mathcal{N}$

$\rightarrow$  that maps each pair  $(\mathbf{n}, \mathbf{e}_i)$  to the element of  $\mathcal{N}$  representing the coset of  $\mathbf{n} + \mathbf{e}_i$ .

APPLICATIONS

## EXAMPLE 1

Let  $C$  be a  $[6, 3, 3]$  binary code with generator matrix  $G$  and parity check matrix  $H$  given by:

$$G = \begin{pmatrix} 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 0 & 1 & 1 \\ 0 & 0 & 1 & 1 & 0 & 1 \end{pmatrix} \quad \text{and} \quad H = \begin{pmatrix} 1 & 0 & 0 & 1 & 1 & 1 \\ 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 0 & 1 & 0 & 1 & 1 \end{pmatrix}$$

→ Binomial ideal associated to  $C$ :

$$I_2(C) = \left\langle \{x_1x_4x_5x_6 - 1, x_2x_5x_6 - 1, x_3x_4x_6 - 1\} \cup \{x_i^2 - 1\}_{i=1,\dots,6} \right\rangle$$

→ The reduced Gröbner basis of  $I_2(C)$  w.r.t. degrevlex order with  $x_1 < \dots < x_6$ :

$$\left\{ \begin{array}{l} x_6x_5 - x_3, \quad x_6x_4 - x_2, \quad x_6x_3 - x_5, \quad x_6x_2 - x_4, \\ x_5x_4 - x_6x_1, \quad x_5x_3 - x_6, \quad x_5x_2 - x_1, \quad x_5x_1 - x_2, \\ x_4x_3 - x_1, \quad x_4x_2 - x_6, \quad x_4x_1 - x_3, \\ x_3x_2 - x_6x_1, \quad x_3x_1 - x_4, \\ x_2x_1 - x_5 \end{array} \right\} \cup \{x_i^2 - 1\}_{i=1,\dots,6}$$

→ which correspond to:  $\mathcal{N} = \{ \mathbf{0}, \mathbf{e}_1, \mathbf{e}_2, \mathbf{e}_3, \mathbf{e}_4, \mathbf{e}_5, \mathbf{e}_6, \mathbf{e}_1 + \mathbf{e}_6 \}$

$$\begin{array}{lll} [\mathbf{0}, [2, 3, 4, 5, 6, 7]], & [\mathbf{e}_1, [1, 5, 6, 3, 4, 8]], & [\mathbf{e}_2, [5, 1, 8, 2, 7, 6]], \\ [\mathbf{e}_3, [6, 8, 1, 7, 2, 5]], & [\mathbf{e}_4, [3, 2, 7, 1, 2, 5]], & [\mathbf{e}_5, [4, 7, 2, 8, 1, 3]], \\ [\mathbf{e}_6, [8, 6, 5, 4, 3, 1]], & [\mathbf{e}_1 + \mathbf{e}_6, [7, 4, 3, 6, 5, 2]] & \end{array}$$

6     for  $k \in \text{supp}(\mathbf{t})$  :  $\mathbf{t} = \mathbf{t}' + \mathbf{e}_k$  with  $\mathbf{t}' \in \mathcal{N}$  do  
7        $\phi(\mathbf{t}', \mathbf{e}_k) \leftarrow \mathbf{t}_j$   
8       if  $w_H(\mathbf{t}) = w_H(\mathbf{t}_j)$  then  
9          $\text{CL}(C)[\mathbf{t}_j] \leftarrow \text{CL}(C)[\mathbf{t}] \cup \{\mathbf{t}\}$ ;  
10        List  $\leftarrow \text{InsertNext}[\mathbf{t}, \text{List}]$ ;  
11    else  
12       $r \leftarrow r + 1$ ;  $\mathbf{t}_r \leftarrow \mathbf{t}$ ;  $\mathcal{N} \leftarrow \mathcal{N} \cup \{\mathbf{t}_r\}$ ;  
13       $\text{CL}(C)[\mathbf{t}_r] \leftarrow \{\mathbf{t}_r\}$ ;  $\mathcal{S} \leftarrow \mathcal{S} \cup \{\mathbf{s}\}$ ;  
14      List =  $\text{InsertNext}[\mathbf{t}_r, \text{List}]$ ;  
15      for  $k \in \text{supp}(\mathbf{t}_r)$  :  $\mathbf{t}_r = \mathbf{t}' + \mathbf{e}_k$  with  $\mathbf{t}' \in \mathcal{N}$  do  
16         $\phi(\mathbf{t}', \mathbf{e}_k) \leftarrow \mathbf{t}_r$ ;  
17         $\phi(\mathbf{t}_r, \mathbf{e}_k) \leftarrow \mathbf{t}'$ ;
```

---

$\rightarrow$  **Complexity:**  $n|\text{CL}(C)| \Rightarrow$  has near-optimal performance.

→ Using algorithm 2.1, we obtain the following list of coset leaders:

Coset Leaders $\text{CL}(\mathcal{C})$	
$\text{CL}(\mathcal{C})_0$	$[\mathbf{0}]$
$\text{CL}(\mathcal{C})_1$	$[\mathbf{e}_1], [\mathbf{e}_2], [\mathbf{e}_3], [\mathbf{e}_4], [\mathbf{e}_5], [\mathbf{e}_6]$
$\text{CL}(\mathcal{C})_2$	$[\mathbf{e}_1 + \mathbf{e}_6, \mathbf{e}_2 + \mathbf{e}_3, \mathbf{e}_4 + \mathbf{e}_5]$

TABLE: List of coset leaders in Example 1

→ The algorithm could be adapted without incrementing the complexity to obtain the following **additional information**:

- **Newton radius** ( $\nu(\mathcal{C})$ ):  
Largest weight of any vector that can be uniquely corrected.
- **Covering radius** ( $\rho(\mathcal{C})$ ):  
Smallest integer  $s$  such that  $\mathbb{F}_q^n$  is the union of the spheres of radius  $s$  centered at the codewords of  $\mathcal{C}$ .
- **Weight Distribution of the Coset leaders (WDCL)**:  
List  $(\alpha_0, \dots, \alpha_n)$  where  $\alpha_i$  is the number of cosets with weight  $i$ .
- **Number of coset leaders in each coset.**

→ **In our example:**  $\nu(\mathcal{C}) = 1$ ,  $\rho(\mathcal{C}) = 2$ ,  $\text{WDCL} = [1, 6, 1, 0, 0, 0]$  and

$$\#(\text{CL}) = \begin{bmatrix} 1, \\ 1, 1, 1, 1, 1 \\ 3 \end{bmatrix}.$$

### APPLICATIONS

## CLASSICAL SYNDROME DECODING

**1** Construct the **syndrome lookup table**.

i.e. enumerate the cosets of  $\mathcal{C}$  in  $\mathbb{F}_q^n$ , choose a coset leader for each coset and compute its syndrome.

**2** If  $\mathbf{y}$  is the received word  $\Rightarrow$  Determine from the table which coset leader  $\mathbf{e}$  satisfies that  $S(\mathbf{y}) = S(\mathbf{e})$ .

**3** Decode  $\mathbf{y}$  as  $\mathbf{y} - \mathbf{e} \in \mathcal{C}$ .

The precomputation of this method **grows exponentially** with the length of the code.

- $\rightarrow$  **Main advantage of GDD:** this task is broken into smaller steps.
- $\rightarrow$  In the literature there are two GDD for binary codes proposed independently by Liebler and Ashikmin and Barg.
- $\rightarrow$  **Both algorithms can be seen as two ways of understanding the reduction associated to the Gröbner representation of the code!!!**

Issue 1, 285-291, 2009.

### SOME REMARKS:

- In each step of the Algorithm 2.2 the vector  $\mathbf{y}$  changes between different cosets of  $\mathbb{F}_2^n / \mathcal{R}_{\mathcal{C}}$  until it arrives to the  $\bar{\mathbf{0}}$  coset, i.e.  $\mathbf{y} \in \mathcal{C}$ .
- This is essentially the **syndrome decoding algorithm** broken up in smaller steps.

CONCLUSIONS

APPLICATIONS

We define the **reduction of an element**  $\mathbf{n} \in \mathcal{N}$  relative to  $\mathbf{e}_i$  as the element  $\mathbf{n}' = \phi(\mathbf{n}, \mathbf{e}_i) \in \mathcal{N}$ , denoted by  $\mathbf{n} \rightarrow_i \mathbf{n}'$ .

→ For each  $\mathbf{y} \in \mathbb{F}_2^n$ ,  $\mathbf{y} = \mathbf{0} + \sum_j \mathbf{e}_j$  for some  $j \in \{1, \dots, n\}$

→ Thus we can **iterate a finite number of reductions** to find the closest codeword.

→ This gives us the following GDDA:

→ See resemblance with **Liebler's Algorithm**.

---

## Algorithm 2.3: $(\mathcal{N}, \phi)$ -reduction

---

**Data:**  $(\mathcal{N}, \phi)$  a Gröbner representation for  $\mathcal{C}$  w.r.t. a total degree ordering and the received word  $\mathbf{y} \in \mathbb{F}_2^n$ .

**Result:** A codeword  $\mathbf{c} \in \mathcal{C}$  that minimized the Hamming distance  $d_H(\mathbf{c}, \mathbf{y})$ .  
 $\mathbf{y} = \sum_{j=1}^s \mathbf{e}_{i_j}$  i.e.  $\text{supp}(\mathbf{y}) = \{i_1, \dots, i_s\}$

**Forward Step:** // Compute  $n \in \mathcal{N}$  corresponding to the coset  $\mathbf{y} + \mathcal{C}$ , i.e.

$\mathbf{n} \in \text{CL}(\mathbf{y})$   
 $\mathbf{n} \leftarrow \mathbf{0}$

for  $j \leftarrow 1$  to  $s$  do

$\mathbf{n} \rightarrow_{i_j} \mathbf{n}'$  // i.e.  $\mathbf{n}' = \phi(\mathbf{n}, \mathbf{e}_{i_j})$   
     $\mathbf{n} \leftarrow \mathbf{n}'$

**Backward Step:**

while  $\mathbf{n} \neq \mathbf{0}$  do

    Find  $i \in \{1, \dots, n\}$  such that  
     $w_H(\mathbf{n}) > w_H(\phi(\mathbf{n}, \mathbf{e}_i))$   
     $\mathbf{y} \leftarrow \mathbf{y} + \mathbf{e}_i$   
     $\mathbf{n} \leftarrow \phi(\mathbf{n}, \mathbf{e}_i)$

Return  $\mathbf{c} = \mathbf{y}$

CONCLUSIONS

APPLICATIONS

→ Associated to the Gröbner representation  $(\mathcal{N}, \phi)$  for the binary code  $\mathcal{C}$  we can define the **border of a code**:

$$\mathcal{B}(\mathcal{C}) = \left\{ (\mathbf{n} + \mathbf{e}_i, \phi(\mathbf{n}, \mathbf{e}_i)) \mid \begin{array}{l} \mathbf{n} + \mathbf{e}_i \neq \phi(\mathbf{n}, \mathbf{e}_i), \mathbf{n} \in \mathcal{N} \\ \text{and } i \in \{1, \dots, n\} \end{array} \right\}$$

→ Let  $\mathbf{b} = (\mathbf{b}_1, \mathbf{b}_2) \in \mathcal{B}(\mathcal{C})$  we define:

$$\text{head}(\mathbf{b}) = \mathbf{b}_1 \in \mathbb{F}_2^n \quad \text{and} \quad \text{tail}(\mathbf{b}) = \mathbf{b}_2 \in \mathbb{F}_2^n$$

→  $\text{head}(\mathbf{b}) + \text{tail}(\mathbf{b}) \in \mathcal{C}$ .

→ The information in the border is somehow **redundant**, we can reduce the number of codewords in it by defining the following structure.

## REDUCED BORDER OF A CODE

Let  $\prec$  be a term ordering. A subset  $R(\mathcal{C}) \subseteq \mathcal{B}(\mathcal{C})$  is called the *reduced border of the code  $\mathcal{C}$*  w.r.t.  $\prec$  if it fulfills the following conditions:

- For each element in the border  $\mathbf{b} \in \mathcal{B}(\mathcal{C})$  there exists an element  $\mathbf{h}$  in  $R(\mathcal{C})$  such that  $\text{supp}(\text{head}(\mathbf{h})) \subseteq \text{supp}(\text{head}(\mathbf{b}))$ .
- For every two different elements  $\mathbf{h}_1$  and  $\mathbf{h}_2$  in  $R(\mathcal{C})$  neither  $\text{supp}(\text{head}(\mathbf{h}_1)) \subseteq \text{supp}(\text{head}(\mathbf{h}_2))$  nor  $\text{supp}(\text{head}(\mathbf{h}_2)) \subseteq \text{supp}(\text{head}(\mathbf{h}_1))$  is verified.

## PROPOSITION:

Let us consider the set of codewords in  $\mathcal{C}$  given by

$$M_{\text{Red}_{\prec}}(\mathcal{C}) = \{\text{head}(\mathbf{b}) + \text{tail}(\mathbf{b}) \mid \mathbf{b} \in R(\mathcal{C})\}$$

Then  $M_{\text{Red}_{\prec}}(\mathcal{C})$  corresponds to a subset of codewords of minimal support of  $\mathcal{C}$ ,  $\mathcal{M}_{\mathcal{C}}$ .

→ Thus  $R(\mathcal{C})$  is a minimal test-set that allow Ashikmin-Barg's GDD.

## 3 MODULAR CODES

- Relationship to integer linear programming
- Minimal support codewords
- How to reduce the complexity?

→ Throughout this section  $\mathcal{C}$  will be a **modular code** of length  $n$  defined over  $\mathbb{Z}_q$ , i.e. a submodule of  $(\mathbb{Z}_q^n, +)$ .

→ The result of this section are joint work with E. Martínez-Moro from University of Valladolid (Spain) and appeared in:

## Modular Integer Program Problem

Let  $A \in \mathbb{Z}_q^{m \times n}$ ,  $\mathbf{b} \in \mathbb{Z}_q^m$  and  $\mathbf{w} \in \mathbb{R}^n$ , we define

$$\text{IP}_{A, \mathbf{w}, q}(\mathbf{b}) = \begin{cases} \text{Minimize } \mathbf{w} \cdot \mathbf{a}\mathbf{u} \\ \text{subject to } \begin{cases} \mathbf{A}\mathbf{u}^t \equiv \mathbf{b} \pmod{q} \\ \mathbf{u} \in \mathbb{Z}_q^n \end{cases} \end{cases}$$

≠ except for the binary case

## Minimum Distance Decoding (MDD)

Let  $\mathcal{C}$  be a linear  $[n, k]$  code. Given a received word  $\mathbf{y} \in \mathbb{F}_q^n$  MDD is to find a codeword  $\mathbf{x} \in \mathcal{C}$  that minimizes the Hamming distance  $d_H(\mathbf{x}, \mathbf{y})$ .

## Test-Set

A *test-set* for  $\text{IP}_{A, \mathbf{w}, q}(\mathbf{b})$  is a subset  $\mathcal{T}_{\succ \mathbf{w}} \subseteq \ker_{\mathbb{Z}_q}(A)$  such that for each non-optimal solution  $\mathbf{u}$  there exists  $t \in \mathcal{T}_{\succ \mathbf{w}}$  such that  $\mathbf{u} - t$  is also a solution and  $t \succ_{\mathbf{w}} \mathbf{0}$ .

≠ except for the binary case

## Test-Set

A *test-set* for the code  $\mathcal{C}$  is a subset

$$\mathcal{T} \subseteq \mathcal{C}$$

such that for every vector  $\mathbf{y} \in \mathbb{F}_q^n$  either  $\mathbf{y} \in \mathcal{C}$  or there exists a  $t \in \mathcal{T}$  such that  $w_H(\mathbf{y} - t) < w_H(\mathbf{y})$

We can define the ideal associated to  $\text{IP}_{A, \mathbf{w}, q}(\mathbf{b})$  as

$$I(A^\perp) = \left\langle \left\{ \mathbf{x} \cdot \mathbf{w}_j - 1 \right\}_{j=1}^k \cup \left\{ x_i^q - 1 \right\}_{i=1}^n \right\rangle$$

where  $\{\mathbf{w}_1, \dots, \mathbf{w}_k\} \subseteq \mathbb{Z}_q^n$  is a set of  $\mathbb{Z}_q$ -generators of the row space of the matrix  $A \in \mathbb{Z}_q^{m \times n}$ .

A reduced Gröbner basis of  $I(A^\perp)$  induced a test-set for  $\text{IP}_{A, \mathbf{w}, q}(\mathbf{b})$

Universal Test-Set for  $\text{IP}_{H, q}(\mathbf{b}) \supseteq$  Codewords of minimal support of  $\mathcal{C}$

A Graver basis of  $I(H^\perp)$

→ The ideal associated to the  $\mathbb{Z}$ -kernel of the matrix  $A \in \mathbb{Z}^{m \times n}$  is:

$$I_A = \langle \{ \mathbf{x}^{\mathbf{u}^+} - \mathbf{x}^{\mathbf{u}^-} \mid \mathbf{u} \in \ker_{\mathbb{Z}}(A) \} \rangle.$$

$\mathcal{U}_A$  = Universal Gröbner basis of  $I_A$ .

→ A binomial  $\mathbf{x}^{\mathbf{u}^+} - \mathbf{x}^{\mathbf{u}^-}$  in  $I_A$  is called **primitive** if there exists no other binomial  $\mathbf{x}^{\mathbf{v}^+} - \mathbf{x}^{\mathbf{v}^-}$  in  $I_A$  such that  $\mathbf{x}^{\mathbf{v}^+}$  divides  $\mathbf{x}^{\mathbf{u}^+}$  or  $\mathbf{x}^{\mathbf{v}^-}$  divides  $\mathbf{x}^{\mathbf{u}^-}$ .

$\text{Gr}_A$  = Graver basis of  $I_A$  = set of primitive binomials of  $I_A$ .

## PROPOSITION

$$\mathcal{U}_A \subseteq \text{Gr}_A$$

## LAWRENCE LIFTING

The Lawrence lifting of the integer matrix  $A \in \mathbb{Z}^{m \times n}$  is the enlarge matrix

$$\Lambda(A) = \left( \begin{array}{c|c} A & 0 \\ \hline 1 & 1 \end{array} \right) \in \mathbb{Z}^{(m+n) \times 2n}$$

Where  $1 \in \mathbb{Z}^{n \times n}$  is the identity matrix and  $0 \in \mathbb{Z}^{m \times n}$  is the zero matrix.

- ▶  $\ker(\Lambda(A)) = \{(\mathbf{u}, -\mathbf{u}) \mid \mathbf{u} \in \ker(A)\}$ .
- ▶  $I_{\Lambda(A)} = \langle \mathbf{x}^{\mathbf{u}^+} \mathbf{y}^{\mathbf{u}^-} - \mathbf{x}^{\mathbf{u}^-} \mathbf{y}^{\mathbf{u}^+} \mid \mathbf{u} \in \ker(A) \rangle \subseteq \mathbb{K}[x_1, \dots, x_n, y_1, \dots, y_n]$ .

## THEOREM (STURMFELS)

For a Lawrence type matrix  $\Lambda(A) \in \mathbb{Z}^{(m+n) \times 2n}$  the following sets of binomials coincide:

$$Gr_{\Lambda(A)} = \mathcal{U}_{\Lambda(A)} = G,$$

where  $G$  is any reduced Gröbner basis of the ideal  $I_{\Lambda(A)}$ .

---

**Algorithm 3.1:** Algorithm for computing the Graver basis of  $I_A$

---

**Data:** An integer matrix  $A \in \mathbb{Z}^{m \times n}$ .

**Result:** The Graver basis of  $I_A$ ,  $Gr_A$ .

- 1 We choose any term order on  $\mathbb{K}[\mathbf{x}, \mathbf{y}]$ ;
- 2 We defined the Lawrence lifting of the matrix  $A := \Lambda(A)$ ;
- 3 We compute a reduced Gröbner basis of  $I_{\Lambda(A)}$ ;
- 4 We substitute the variable  $\mathbf{y}$  by  $\mathbf{1}$ ;

## MINIMAL SUPPORT CODEWORD

A nonzero codeword  $\mathbf{m}$  in  $\mathcal{C}$  is a *minimal support codeword* if there is no other codeword  $\mathbf{c} \in \mathcal{C}$  such that

$$\text{supp}(\mathbf{c}) \subseteq \text{supp}(\mathbf{m}).$$

→ We denote by  $\mathcal{M}_{\mathcal{C}}$  the set of codewords of minimal support of  $\mathcal{C}$ .

## THEOREM [MÁRQUEZ-MARTÍNEZ 2011]

Choose a parity check matrix  $H \in \mathbb{Z}_q^{(n-k) \times n}$  for  $\mathcal{C}$ .

→  $\mathcal{M}_{\mathcal{C}}$  is a subset of the Graver basis of  $H$ .

## COROLLARY

$\mathcal{M}_{\mathcal{C}}$  can be computed from any Gröbner basis of the ideal

$$\left\langle \left\{ \mathbf{x}^{\Delta \mathbf{w}_1} \mathbf{z}^{\Delta \mathbf{w}_1 (q-1)} - 1, \dots, \mathbf{x}^{\Delta \mathbf{w}_k} \mathbf{z}^{\Delta \mathbf{w}_k (q-1)} - 1 \right\} \cup \{x_i^q - 1\}_{i=1}^n \cup \{z_i^q - 1\}_{i=1}^n \right\rangle$$

where  $\{\mathbf{w}_1, \dots, \mathbf{w}_k\} \subseteq \mathbb{Z}_q^n$  are the rows of a generator matrix of  $\mathcal{C}$ .

## 1 FGLM technique to compute a Gröbner basis

- We know a set of generators of the ideal  $I(\mathcal{C})$  :

$$I(\mathcal{C}) = \left\langle \{ \mathbf{X}^{\mathbf{A}\mathbf{w}_i} - 1 \}_{i=1, \dots, k} \cup \{ X_i^q - 1 \}_{i=1}^n \right\rangle$$

where  $\{\mathbf{w}_1, \dots, \mathbf{w}_k\} \subseteq \mathbb{Z}_q^n$  are rows of a generator matrix of  $\mathcal{C}$ .

- In order to compute a Gröbner basis of  $I(\mathcal{C})$  we can use FGLM-techniques.

M. Borges-Quintana, M.A. Borges-Trenard, P. Fitzpatrick and E. Martínez-Moro, *Gröbner bases and combinatorics for binary codes*, Appl. Algebra Engr. Comm. Comput. Volume 19, no.5, 393–411, 2008.

- This procedure is completely general and it has the following advantages:
  - The problem of **growth of the total degree** do not have to be considered since the total degree of the binomials involved is bounded by  $n \times q$ .
  - The problem of **coefficient growth** do not have to be considered since we can take as base field  $\mathbb{K} = \mathbb{F}_2$ .
  - All the steps can be carried out as Gaussian elimination steps.

## 2 Decomposition of modular codes

- We can reduce the complexity by using the decomposition of a given code as “gluing” of smaller ones.

Our aim is to explicitly define a procedure that:

- 1 (Decomposition) Find a decomposition of an  $[n, k]$ -code  $\mathcal{C}$  into the  $m$ -gluing of two (or more) smaller codes, denoted by  $\{\mathcal{C}_\alpha\}_{\alpha \in A}$ .
- 2 Compute  $\mathcal{M}_{\mathcal{C}_\alpha}$  the set of codewords of minimal support of  $\mathcal{C}_\alpha$  for each  $\alpha \in A$ .
- 3 (Gluing) Compute  $\mathcal{M}_{\mathcal{C}}$  from  $\{\mathcal{M}_{\mathcal{C}_\alpha}\}_{\alpha \in A}$ .

- **Parallel computing** is well suited for **Step 2**.
- A similar process can be defined to compute the **Gröbner test-set** for a **binary code**.
- The concept of “glue” was already used by other authors:

J.C. Rosales,

*On presentations of subsemigroups of  $\mathbb{N}^n$ ,*  
Semigroup Forum, 55(2):152-159, 1997.

CONCLUSIONS

APPLICATIONS

→ Let  $\alpha$  be a **primitive element** of  $\mathbb{F}_q^*$ .

**Characteristic crossing functions:**

$$\nabla : \{0, 1\}^{q-1} \longrightarrow \mathbb{F}_q \quad \text{and} \quad \Delta : \mathbb{Z}_q \longrightarrow \{0, 1\}^{q-1} .$$

- The map  $\Delta$  replace  $\left\{ \begin{array}{l} \text{the element } \mathbf{a} = \alpha^j \in \mathbb{F}_q^* \text{ by the unit vector } \mathbf{e}_j \in \mathbb{Z}^{m-1} \\ \text{and } 0 \text{ by the zero vector } \mathbf{0} \in \mathbb{Z}^{q-1} . \end{array} \right.$
- The map  $\overline{\nabla}$  recovers the element  $j_1 \alpha + j_2 \alpha^2 + \dots + j_{q-1} \alpha^{q-1}$  from the binary vector  $(j_1, \dots, j_{q-1})$ .

→ Let  $\mathbf{X}$  denotes  $n$  vector variables  $X_1, \dots, X_n$

→ Each variable  $X_i$  is decomposed into  $q - 1$  components:  $X_{i1} \cdots X_{iq-1}$

→ Let  $\mathbf{a} \in \mathbb{F}_q^n$  we adopt the following notation:

$$\begin{aligned} \mathbf{X}^{\mathbf{a}} &= X_1^{a_1} \cdot X_2^{a_2} \cdots X_n^{a_n} \\ &= (X_{11} \cdots X_{1q-1})^{\Delta a_1} \cdot (X_{21} \cdots X_{2q-1})^{\Delta a_2} \cdots (X_{n1} \cdots X_{nq-1})^{\Delta a_n} \end{aligned}$$

**Key idea:** For all  $\mathbf{a} \in \mathbb{F}_q^n$ :  $\deg(\mathbf{X}^{\mathbf{a}}) = w_H(\mathbf{a})$ .

Weight compatible ordering on  $\mathbb{F}_q^n$  = Total degree ordering on  $\mathbb{K}[\mathbf{X}]$

## THEOREM: IDEAL ASSOCIATED TO $\mathcal{C}$

Given the rows of a generator matrix of  $\mathcal{C}$ , labelled by  $\mathbf{w}_1, \dots, \mathbf{w}_k$ . The following ideal match the ideal  $I(\mathcal{C})$ :

$$I_+(\mathcal{C}) = \left\langle \left\{ \mathbf{X}^{\alpha^j \mathbf{w}_i} - 1 \right\}_{\substack{i=1, \dots, k \\ j=1, \dots, q-1}} \cup \left\{ \mathcal{R}_{X_i}(T_+) \right\}_{i=1, \dots, n} \right\rangle \subseteq \mathbb{K}[\mathbf{X}]$$

where  $\mathcal{R}_{X_i}(T_+)$  consist of all the binomials on the variable  $X_i$  associated to the relations given by the additive table of the field  $\mathbb{F}_q = \langle \alpha \rangle$ , i.e.

$$\mathcal{R}_{X_i}(T_+) = \left\{ \begin{array}{l} \{X_{iu}X_{iv} - X_{iw} \mid \alpha^u + \alpha^v = \alpha^w\} \\ \{X_{iu}X_{iv} - 1 \mid \alpha^u + \alpha^v = 0\} \end{array} \right\}$$

Moreover:

- 1 We compute a **Gröbner representation** of  $\mathcal{C}$ .
- 2 We show that the binomials involved in the reduced Gröbner basis of  $I_+(\mathcal{C})$  w.r.t. a degree compatible ordering define a test-set for  $\mathcal{C}$ .
- 3 We define two gradient descent decoding algorithms.
- 4 We discuss an alternative for the computation of the Gröbner basis of  $I_+(\mathcal{C})$ .
- 5 We compute the set of codewords of minimal support of  $\mathcal{C}$ .

Commutative semigroup  
with an identity element

$S$  is assumed to be **finitely generated**

$S$  is **cancellative**  $\Rightarrow m + n = m + n'$  with  $m, n, n' \in S$  then  $n = n'$ .

$S$  is **combinatorially finite**  $\Rightarrow$  exists finitely many ways to write every  $\mathbf{a} \in S \setminus \{0\}$  as a sum  $\mathbf{a} = \mathbf{a}_1 + \dots + \mathbf{a}_s$  with  $\mathbf{a}_i \in S \setminus \{0\}$ .

CONCLUSIONS

APPLICATIONS

- The choice of a system of generators  $\{\mathbf{n}_1, \dots, \mathbf{n}_r\}$  of  $S$  induces a natural semigroup morphism

$$\begin{array}{rcl} \pi : \mathbb{N}^r & \longrightarrow & S \\ \mathbf{e}_j & \longmapsto & \mathbf{n}_j \\ \mathbf{a} & \longmapsto & \sum_{i=1}^r a_i \mathbf{n}_i \end{array}$$

- Semigroup algebra of  $S$ : We write  $\mathbb{K}[S]$  for the  $\mathbb{K}$ -vector space:

$$\mathbb{K}[S] = \left\{ \sum_{\mathbf{n} \in S} a_{\mathbf{n}} \mathbf{t}^{\mathbf{n}} \mid a_{\mathbf{n}} \in \mathbb{K} \right\}$$

endowed with a multiplication which is  $\mathbb{K}$ -linear and satisfies that  $\mathbf{t}^{\mathbf{a}} \cdot \mathbf{t}^{\mathbf{b}} = \mathbf{t}^{\mathbf{a}+\mathbf{b}}$  with  $\mathbf{a}, \mathbf{b} \in S$ .

- $\pi$  defines a  $\mathbb{K}$ -algebra morphism:

$$\begin{array}{rcl} \varphi : \mathbb{K}[\mathbf{X}] & \longrightarrow & \mathbb{K}[S] \\ X_i & \longmapsto & \mathbf{t}^{\mathbf{n}_i} \end{array}$$

- Semigroup ideal associated to  $S$ :  $I(S) = \ker(\varphi)$ , i.e.

$$I(S) = \left\langle \left\{ \mathbf{x}^{\mathbf{a}} - \mathbf{x}^{\mathbf{b}} \mid \sum_{i=1}^r a_i \mathbf{n}_i = \sum_{i=1}^r b_i \mathbf{n}_i \text{ with } \mathbf{a}, \mathbf{b} \in \mathbb{N}^r \right\} \right\rangle.$$

### APPLICATIONS

→ We describe the **lattice**  $\mathcal{L}$  as

$$\mathcal{L} = \left\{ \mathbf{u} \in \mathbb{Z}^r \mid \sum_{i=1}^r u_i \mathbf{n}_i = \mathbf{0} \right\} \subseteq \mathbb{Z}^r.$$

i.e. set of integer solutions of the system  $A\mathbf{X} = \mathbf{0}$  where  $A = \{\mathbf{n}_1, \dots, \mathbf{n}_r\}$  is a fix system of generators of  $S$

→ Given a lattice  $\mathcal{L} \subset \mathbb{Z}^r$ , the binomial ideal

$$I_{\mathcal{L}} = \left\langle \{ \mathbf{X}^{\mathbf{a}} - \mathbf{X}^{\mathbf{b}} \mid \mathbf{a} - \mathbf{b} \in \mathcal{L} \} \right\rangle$$

is called the **lattice ideal associated to**  $\mathcal{L}$ .

→ If  $I_{\mathcal{L}} = I(S)$ , then we have an **exact sequence** of abelian groups given by:

$$0 \longrightarrow \mathcal{L} \longrightarrow G(\mathbb{N}^r) = \mathbb{Z}^r \longrightarrow G(S) \longrightarrow 0.$$

APPLICATIONS

## Characteristic crossing functions:

$$\blacktriangledown : \mathbb{Z}^s \longrightarrow \mathbb{Z}_m^s \quad \text{and} \quad \blacktriangle : \mathbb{Z}_m^s \longrightarrow \mathbb{Z}^s$$

- The map  $\blacktriangledown$  is reduction modulo  $m$ .
- The map  $\blacktriangle$  replace the class of  $0, 1, \dots, m-1$  by the same symbols regarded as integers.

→ Let  $\mathcal{C}$  be an  $[n, k]$  **modular** code over  $\mathbb{Z}_m$  with generator and parity check matrices:

$$G = \begin{pmatrix} g_{11} & \cdots & g_{1n} \\ \vdots & \ddots & \vdots \\ g_{i1} & \cdots & g_{in} \\ \vdots & \ddots & \vdots \\ g_{k1} & \cdots & g_{kn} \end{pmatrix} \in \mathbb{Z}_m^{k \times n}$$

$\mathbf{g}_i$

$$H = \begin{pmatrix} h_{11} & \cdots & h_{1j} & \cdots & h_{1n} \\ \vdots & \ddots & \vdots & \ddots & \vdots \\ h_{i1} & \cdots & h_{ij} & \cdots & h_{in} \end{pmatrix} \in \mathbb{Z}_m^{l \times n}$$

$\mathbf{h}_i$

Ideal associated to  $\mathcal{C}$ :

$$I_m(\mathcal{C}) = \langle \{ \mathbf{x}^{\mathbf{g}_i} - 1 \}_{i=1, \dots, k} \cup \{ \mathbf{x}^{\mathbf{h}_j} - 1 \} \rangle$$

- Provides  $\mathcal{M}_{\mathcal{C}}$ .
- Does not allow Complete Decoding.

PROPOSITION:

Consider the semigroup  $S$  generated by  $\{\mathbf{h}_i\}_{i=1, \dots, n}$  then

$$I_m(\mathcal{C}) = I(S)$$

CONCLUSIONS

### APPLICATIONS

#### PROPOSITION:

Let  $\mathcal{C}$  be an  $[n, k]$  modular code over  $\mathbb{Z}_m$  and  $H \in \mathbb{Z}_m^{(n-k) \times n}$  be a parity check matrix of  $\mathcal{C}$ . Consider the commutative semigroup  $S$  finitely generated by  $\{\mathbf{h}_i\}_{i=1, \dots, n}$  where  $\mathbf{h}_j$  denotes the  $j$ -th column of  $H$ . Then:

- 1  $I(S) = I_m(\mathcal{C})$ .
- 2  $S$  is not combinatorially finite.
- 3  $S = G(S) \subseteq \mathbb{Z}_m^{n-k}$ , i.e.  $S = -S$ .
- 4  $G(S)$  is a torsion group since  $m\mathbf{a} \equiv \mathbf{0} \pmod{m}$ ,  $\forall \mathbf{a} \in S$ .
- 5 The lattice  $\mathcal{L}_1 = \left\{ \mathbf{u} \in \mathbb{Z}^n \mid \sum_{i=1}^n u_i \mathbf{h}_i \equiv \mathbf{0} \pmod{m} \right\}$  is the set  $\mathbf{a}\mathcal{C} + (m\mathbb{Z}^n)$ .

Then  $I_m(\mathcal{C}) = I_{\mathcal{L}_1}$  and we have the following exact sequence of abelian groups:

$$0 \longrightarrow \mathcal{L}_1 \longrightarrow G(\mathbb{N}^n) = \mathbb{Z}^n \longrightarrow G(S) = S \longrightarrow 0$$

## DIGITAL REPRESENTATION

The generating set  $F = \{\mathbf{n}_1, \dots, \mathbf{n}_r\}$  of a semigroup  $S$  is called a *digital representation* of  $S$  if every element  $\mathbf{m} \in S$  can be written as

$$\sum_{i=1}^r a_i \mathbf{n}_i \text{ with } a_1, \dots, a_r \in \{0, 1\} \subseteq \mathbb{N}.$$

The choice of **digital representations** of  $S$  provides not only complete decoding algorithms but also the set of codewords of minimal support.
